

## ABSTRACT

Disclosed is an arrangement for electrically connecting an electrical unit (9) to at least one electrical component (18) by means of a flexible foil conductor (6). The electrical unit (9) has at least one electrical assembly (17) and is arranged inside a case (10). The electrical component (18) is provided outside the case (10). Several assemblies (17) are provided inside the case (10) and each assembly (17) is connected to its associated electrical component(s) (18) via a separate foil conductor (6). This arrangement is simple, flexibly usable, and process-safe.
